

OGUN USA

Web site plan

May 2026

The web site design will evoke defense tech innovation

Ogun LLC is a temporary entity name for a defense tech startup that will compete with:

- Anduril
- Helsing

The web site plan takes inspiration from:

- Saronic

The company is forming an integrated computation design and additive manufacturing system. Companies providing enabling software include:

- Neural Concept
- nTop
- Simcale

Ogun's web site should use similar design to communicate the company's intent to customers, employees, and investors:

- White sans serif font on black
- Video of engineered products

Ogun's logo uses the Sansation font.

High Velocity Engineering

Capabilities

The proprietary High Velocity Engineering system significantly accelerates turning creativity into products.

The platform integrates CAD design with embedded CFD and FEA modeling and optimization using generative AI. Simulated results are closely tracked to real world validation for continual improvement.

Results:

- Lower cost to experiment
- Remove process friction and focus on insights that improve performance
- Fast learning, iteration, and improvement

Computational design

Unifies engineering tasks and workflows

AI-optimization

Enables interactive what/if scenarios and optimization

Scalable manufacturing

Rapid, mass customizable production with precision

Aerospace & Defense Products

Built in Michigan

Aerospace & Defense Products

We are delivering on US defense goals for mass-produced, low-cost, modular solutions.

We are currently iterating a product concept that reinvents optimizing combustion and gas plume management for improved performance.

Can use the embedded videos for now. These are placeholders and should be improved promptly.

Open positions

Senior Software Engineer, Computational Design

We are building the High Velocity Engineering system: a new approach to engineering and manufacturing that accelerates creative insights to modeling to manufacturing for rapid iteration, learning, and improvement. The system integrates CAD/CAM, AI-optimized generative design embedding CFD and FEA physics simulation, and additive manufacturing into a single coherent platform.

You will contribute across the full lifecycle: architecture decisions, implementation, and production operations. You own your work from design through post-deployment monitoring. We seek curious, continual learners who can practically apply new technology into concrete results.

Senior Software Engineer, Computational Design

We are building the High Velocity Engineering system: a new approach to engineering and manufacturing that accelerates creative insights to modeling to manufacturing for rapid iteration, learning, and improvement. The system integrates CAD/CAM, AI-optimized generative design embedding CFD and FEA physics simulation, and additive manufacturing into a single coherent platform.

You will contribute across the full lifecycle: architecture decisions, implementation, and production operations. You own your work from design through post-deployment monitoring. We seek curious, continual learners who can practically apply new technology into concrete results.

What you will do

Design and implement core subsystems connecting CAD/CAM pipelines, generative design solvers, and physics simulation engines. Contribute to AI-assisted tooling and workflows that accelerate development across the engineering team. Build cloud-native services on Azure that meet strict reliability and performance requirements. Deeply understand how product engineers work, the problems they solve, and how products designs are translated into scalable manufacturing.

Core requirements

- 3 to 12 years of professional software engineering experience
- Hands-on cloud experience, preferably Azure; comfort with distributed systems and managed services
- Fluency in Python or R for scientific computing or data workflows
- Proficiency in C# or Java for production service development
- Familiarity with AI-assisted development tools and workflows (Claude Code, Codex, Cursor, Github Copilot)
- STEM degree from a competitive university; master's degree or PhD preferred. We value real world results so a strong track record shipping analytic software products more than fulfills this requirement.

Join (2/2)

Ideal qualifications

Not all of these are required. Strong candidates will bring depth in at least a few.

- Expert-level cloud certification: AWS Solutions Architect Professional, Microsoft Certified Azure Solutions Architect Expert, or GCP Professional Cloud Architect
- Applied experience with LLM integration patterns: retrieval-augmented generation, agentic orchestration, and prompt engineering for production use
- Comfort with event-driven and reactive architectures using tools like Kafka, Azure Service Bus, or Dapr
- Working knowledge of domain-driven design, hexagonal architecture, and CQRS/event sourcing patterns
- Experience with GitOps, infrastructure-as-code (Terraform or Bicep), and platform engineering principles
- Familiarity with WebAssembly, edge compute, or high-performance numerical computing
- Demonstrated skill in computational optimization: reducing latency, increasing throughput, and efficiently using compute at scale
- Background in CAD geometry kernels, FEA/CFD solvers, or additive manufacturing workflows

We care more about how you think, your values, and what you have built more than where you went to school or what titles you have held. If this work sounds like what you want to spend the next few years, we want to hear from you.

Benefits for all roles

- Stock options sharing equity value creation
- Competitive base salary with opportunity for bonus
- Insurance and gym membership
- Generous time off
- Parental leave

Business Summary

Topics

- Suppressors explained
- Executive summary
- Purpose, problem, solution
- Market, competition
- Financials
- Vision in five years

Suppressors explained

- Suppressors, also called silencers, slow exhaust gas leaving a muzzle (the end of a barrel). This reduces sound and recoil while often increasing backpressure (gas pressure within a weapon's action that drives ejecting and loading ammunition)
- Rifles and pistols produce ~160db of sound, which suppressors reduce by ~25-35db depending on ammunition type, barrel length, and other factors. US government standards recommend a maximum of 85db for sustained exposure
- Beyond sound reduction, users value low backpressure (preventing gas from spraying from the rear of the weapon often toward a user's face), lighter weight, smaller size, and easy attachment.
- Suppressor design is essentially unchanged since the first commercial offering in 1901. Materials to make suppressors have evolved including heat-treated stainless steel, titanium, and nickel-based "superalloys" such as Inconel
- Some manufacturers are beginning to use 3D printing (additive manufacturing). There are many different 3D printing techniques
- Manufacturing uses machines and tools similar to automotive parts, which has led to many undifferentiated "me too" products
- The National Firearms Act of 1934 regulates suppressors. Recently, the One Big Beautiful Bill removed the \$200 stamp tax
- The US Army and Marine Corps are broadly adopting suppressors

Executive summary

1	Purpose	Disrupt the suppressor market by integrating software-based simulation and optimization with advanced additive manufacturing and a tech industry-based fast learning and iteration approach
2	Problem	Suppressor design is essentially unchanged since Hiram Maxim’s first design in 1901
3	Solution	• Software-driven engineering: pair computational fluid dynamics with generative design to optimize designs • Hardware delivery with additive manufacturing: form an integrated system, and confirm simulation vs. real world • Creativity: porting, Venturi effect¹, and potential advanced options like active noise cancelling • Design: form follows function, e.g. carbon fiber sheath that accelerates heat transfer while presenting a futuristic aesthetic
4	Competition	Basic suppressors can be manufactured similarly to automotive parts. Low barrier to entry has led to many undifferentiated “me too” offerings. Benchmark against AAC, B&T, GemTech, Knight Armament, Ruger, Sig Sauer, Silencer Central, SilencerCo
5	Market	Cite growth in US firearms market and then suppressor market size trends. Research global market. Fragmented. Anecdotally, firearms retailers cite demand exceeding supply with many suppliers on backorder.
6	Financials	Disciplined, capital-light approach. Initially run as a software company initially with manufacturing outsourced and/or with small, used printers. Confirm product/market fit before applying capital to scale. Capital request at \$1.5M
7	Vision	Build software and manufacturing capabilities consistently applying digital innovation to firearms products ahead of the market. Monetize through energetic GTM execution. In five years, capture 10-15% of the estimated (size) US market realizing \$220-320M in revenue with 20-25% gross margins, leading to an enterprise valuation exceeding \$500M

① Purpose

Disrupt suppressor engineering with a high velocity system integrating software simulation and AI optimization with additive manufacturing for fast iteration and

② Problem

Suppressor design is essentially unchanged in over 100 years

1901

2026

3 Solution

Software

- Computational fluid dynamics to simulate gas plume deceleration, backpressure, and heat transfer

- Generative design AI optimizing structures within a set of constraints

+

Hardware: additive manufacturing

- Advanced 3D printing techniques such as wire arc additive manufacturing
- Simplicity, e.g. no welds or small parts, minimal types of materials
- Capital-efficient: essentially a software business that can outsource much manufacturing

+

Design

- Simulate and validate innovative options such as porting, Venturi effect¹, and active noise cancelling
- Inexpensive, fast experimentation
- Aesthetically attractive

1. The Venturi affect applied to firearms generally means using gases to pull ambient air across the barrel for cooling, e.g. the shroud on the barrel of Lewis machine guns used in World War I

7 Vision

2030:

- Capture 10-15% of a ~\$1.5B US consumer market
- Win military contracts
- Build capabilities can expand selectively into integrating
- Form a strong team and culture valuing people
- Achieve valuation exceeding \$500M

OGUN USA
